Have you been hospitalized 2 or more times in the past year and taken antibiotics?

Are you planning a surgical procedure?

You may be at risk for a serious health associated infection called Clostridium difficile or C.diff.

This office is currently recruiting volunteers for a Vaccine Research Trial for the disease of clostridium difficile or more commonly known as C. diff.
Clostridium difficile (C. diff) is a potentially deadly, spore-forming bacterium emerging as the leading cause of life-threatening, healthcare-associated infections worldwide.

C. diff toxins cause gastrointestinal disease that can lead to death. Symptoms range from mild diarrhea to life-threatening colitis and often include dehydration, abdominal pain and spasms.

350,000 American people are hospitalized every year due to this disease, 77% of cases being in people above 50 years old.

In hospital wards, C. diff contamination has been found on 49% of sites in rooms occupied by previous patients with C. diff even after cleaning measures.
